

L35

PHOTOELECTRIC LINEAR ENCODER

The precision sealed linear encoder L35 is used to convert linear displacements of key machine components into electrical signals containing information about the value and direction of the displacements.

The encoder consists of a glass scale installed into a rigid hollow housing and a ball-bearing-guided reading head. To be able to work in harsh environments (cooling liquid, lubricants and chips), the encoder has two rows of sealing lips. Filtered air can be supplied into the housing of the encoder for extra protection from dust.

Characteristic feature of encoder is a rigid housing that provides better resistance to vibration and higher protection grade due two pairs of sealing lips.

Reference mark can be selected by magnet, which

moves in horizontal groove on the front side of encoder (optional).

Three versions of output signals are available:

- L35-A - sinusoidal signals, with amplitude approx. 11 μ App.
- L35-AV- sinusoidal signals, with amplitude approx. 1 Vpp.
- L35-F - square-wave signals, type TTL or HTL (standard RS422) with integrated subdividing electronics for interpolation x1, x2, x5, x10, x25, x50.
